

## **SafeHome Duo Installation Instructions**

The Duo installs like an ordinary filter. To install the Duo, first remove the plastic wrapping and position the Duo so that air enters the white side and exits the grey side.

- Furnace filter slots: Wrap the excess material tightly around the internal frame and slide the filter into the slot, tucking in the edge to shut the filter slot door.
- Air return grilles: Place the bottom edge of the filter in first and fold excess material behind the internal frame as you lift the filter in to the grill.

For continuous optimal air quality, turn your thermostat's fan switch to 'on' instead of 'auto'. This allows the Duo to continually filter air in your home. Your heating or cooling elements, which use significant amounts of energy, operate independent of the fan and should continue to operate automatically.
